

# Lockdown for Legacy Servers and Desktops

Comprehensive protection including blocking known exploits, zero-day attacks and ransomware.

## Highlights

- Suitable for both desktop and server systems
- Covers most end of life servers and desktop operating systems including Windows XP, Windows 2000, Windows 2003 and older Linux versions
- Staged deployment approach with no business impact
- Integration with existing security processes and tools
- Fully managed service or skills transfer to operational teams

## Benefits

- Up and running in weeks with no business impact using our proven deployment methodology
- Comprehensive protection including blocking known exploits, zero-day attacks and ransomware
- No need to patch servers once the solution deployed
- Enables full compliance for legacy operating systems including PCI and PSN compliance

JON LITTLEFAIR, HEAD OF WORKSPACE PRACTICE

Have complete confidence in the security of your legacy systems, there is **no need to worry about them again** until you come to decommission them.

Despite strategic initiatives to remove them, many organisations have been left with legacy server and desktop systems within their infrastructure. Upgrades have proven to be too complex or costly, but the business still needs the applications, so they remain on the network. These unprotected systems are more vulnerable to attacks such as ransomware and are associated with high costs due to service outages, data loss and business recovery.

Our Legacy Systems Lockdown is a proven solution that provides complete lockdown at the core of the operating system with no impact to applications or business processes. Once deployed, the systems are highly secure and there is no need to patch or worry about them when a new attack or vulnerability surfaces. Our solution reduces both risk and operational costs for your business and there is no need to worry about these servers again until they are decommissioned.

## Case studies

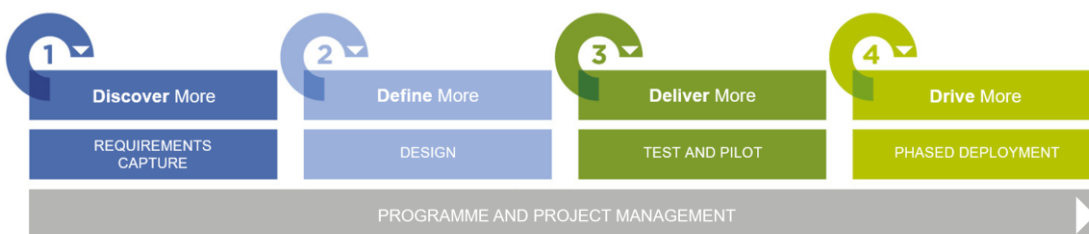

Company85 has been working with organisations to lockdown legacy systems since before the end of life announcements for Windows XP and Windows 2003.

- European Financial Services: Company85 secured their Windows XP based cashpoint systems, achieving full PCI certification, despite running an out-of-support operating system.
- UK Police Force: Following an upgrade initiative the force was left with a number of legacy servers that could not be upgraded. Company85 locked down both operating systems and applications providing complete confidence in the security of their systems and maintaining PSN compliance.
- Global Business Services Outsourcing: Company85 are providing a fully managed service to ensure their Windows 2003 servers stay secure until they can be retired.

## Our methodology

Company85's Accomplish More 4D methodology is a robust, proven, four stage approach to delivering IT transformation with minimal impact to the business.

Our technical specialists and project managers bring extensive experience, and work collaboratively with internal IT teams to ensure the solution meets their needs.
